BARRACUDA

All major equipment manufacturers have developed Rubber Track Drive Systems in the past few years because of less compaction and greater stability on soft ground. Taking advantage of this, the new track driven Barracuda beach cleaner prevents compaction while aiding in operator's comfort. The track suspension creates less effort for controls and less vibrations compared to older models. The Barracuda is an excellent choice for working on the sensitive beach environment and because of its size, it will produce less disruption to sand areas. This beach cleaner model is designed for sand areas in the small to medium size range and is well suited for soft sand. Screens remove easily from the rear to accommodate sand conditions.

The Barracuda walk behind can remove broken glass, cigarette filters, syringes, stones, sea shells, weeds, wood, pop-tops, hardened tar balls and animal droppings from beaches, golf bunkers or any sand areas. With the intensive sifting action of the screen, the sand is well aerated allowing the ultraviolet rays of the sun to dry and sanitize the sand. This process helps eliminate harmful bacteria buildup and is recommended by many agencies around the world.

The Barracuda has very little sand compaction, because of the very low (pounds per square inch) footprint created by the rubber tracks. It also has the sifting screening action behind the drive tracks. The result is very few tire tracks and less compaction on the finished area compared to other older front sifting action models on the market.

Power	Honda GX 6.5 HP
Transmission	3 Forward, 1 Reverse
Working Width	35.4 inches
Working Depth	Up to 4 Inches
Weight of Unit	680 lbs.
